

Supply station for 5 pneumatic test axles

The supply terminal is used as a connector for up to 5 test shafts. It converts the CAN-protocol to USB and therefore is the connection to the PC.

The cables for connecting the test shafts are built-in. Furthermore it contains a central emergency stop, which can shut off all shafts in a hazardous situation. The air conditioning consisting of filter, switch-on-valve and distributor is also situated on the supply terminal. The test shafts can be attached via hoses with quick disconnect couplers.

The supply terminal consists of:

- Controller for protocol conversion and central supervision
- Control voltage supply for the test shafts
- Air conditioning
- Emergency stop
- 5 sets of connection cables for the test shafts
